

HIGHLIGHTS OF PRESCRIBING INFORMATION

These highlights do not include all the information needed to use trospium chloride tablets, USP safely and effectively. See full prescribing information for trospium chloride tablets, USP.

Trospium chloride tablets, USP, for oral use

Initial U.S. Approval: 2004

RECENT MAJOR CHANGES

Warnings and Precautions, Central Nervous System Effects (5.5)
07/2012

INDICATIONS AND USAGE

Trospium chloride tablets, USP are a muscarinic antagonist indicated for the treatment of overactive bladder (OAB) with symptoms of urge urinary incontinence, urgency, and urinary frequency. (1)

DOSAGE AND ADMINISTRATION

- The recommended dose of trospium chloride is one 20 mg tablet twice daily. Trospium chloride tablets should be dosed with water on an empty stomach, at least one hour before a meal. (2)
- For patients with severe renal impairment (creatinine clearance less than 30 mL/min), the recommended dose is 20 mg once daily at bedtime. (2)
- In geriatric patients greater than or equal to 75 years of age, dose may be titrated down to 20 mg once daily based upon tolerability. (2)

DOSAGE FORMS AND STRENGTHS

- 20 mg tablets. (3)

CONTRAINDICATIONS

- Trospium chloride tablets are contraindicated in patients with urinary retention, gastric retention, or uncontrolled narrow-angle glaucoma, and in patients who are at risk for these conditions (4)
- patients with known hypersensitivity (4)

WARNINGS AND PRECAUTIONS

- Trospium chloride tablets should be administered with caution to patients with clinically significant bladder outflow obstruction or gastrointestinal obstructive disorders due to risk of urinary or gastric retention. (5.1, 5.3)

- Angioedema of the face, lips, tongue and/or larynx has been reported with trospium chloride. (5.2)
- In patients with controlled narrow angle glaucoma trospium chloride tablets should be used only with careful monitoring. (5.4)
- Central Nervous System Effects: Somnolence has been reported with trospium chloride tablets. Advise patients not to drive or operate heavy machinery until they know how trospium chloride tablets affect them. (5.5)
- Trospium is substantially excreted by the kidney. The effects of moderate renal impairment on systemic exposure are not known but systemic exposure is likely increased. Therefore, the risk of anticholinergic adverse reactions is expected to be greater in patients with moderate renal impairment. (5.6)

ADVERSE REACTIONS

The most common adverse reactions (greater than or equal to 1%) with trospium chloride tablets are dry mouth (20.1%), constipation (9.6%), and headache (4.2%). (6.1)

To report SUSPECTED ADVERSE REACTIONS, contact Apotex Corp., Drug Safety at 1-800-706-5575 or FDA at 1-800-FDA-1088 or www.fda.gov/medwatch.

DRUG INTERACTIONS

- Concomitant use with digoxin did not affect the pharmacokinetics of either drug. (7.1)
- Some drugs which are actively secreted by the kidney may interact with trospium chloride tablets by competing for renal tubular secretion. (7.2)
- Concomitant use with metformin immediate release tablets reduced exposure and peak concentration of trospium. (7.4)

USE IN SPECIFIC POPULATIONS

The safety and effectiveness of trospium chloride tablets in pediatric patients have not been established. (8.4)

See 17 for PATIENT COUNSELING INFORMATION and FDA-approved patient labeling

FULL PRESCRIBING INFORMATION

1 INDICATIONS AND USAGE

Trospium chloride tablets, USP are a muscarinic antagonist indicated for the treatment of overactive bladder (OAB) with symptoms of urge urinary incontinence, urgency, and urinary frequency.

2 DOSAGE AND ADMINISTRATION

The recommended dose is 20 mg twice daily. Trospium chloride tablets should be dosed at least one hour before meals or given on an empty stomach.

Dosage modification is recommended in the following patient populations:

- For patients with severe renal impairment (creatinine clearance less than 30 mL/min), the recommended dose is 20 mg once daily at bedtime [see *Warnings and Precautions (5.5)*, *Use in Specific Populations (8.6)*, and *Clinical Pharmacology (12.3)*].
- In geriatric patients greater than or equal to 75 years of age, dose may be titrated down to 20 mg once daily based upon tolerability [see *Use in Specific Populations (8.5)*].

3 DOSAGE FORMS AND STRENGTHS

Trospium chloride tablets, USP are supplied as 20 mg (brownish-yellow, round, biconvex, film-coated tablets, engraved "APO" on one side and "TR" over "20" on the other side).

4 CONTRAINDICATIONS

Trospium chloride tablets are contraindicated in patients with:

- urinary retention
- gastric retention
- uncontrolled narrow-angle glaucoma.
- known hypersensitivity to the drug or its ingredients. Angioedema, rash and anaphylactic reaction have been reported.

5 WARNINGS AND PRECAUTIONS

5.1 Risk of Urinary Retention

Trospium chloride tablets should be administered with caution to patients with clinically significant bladder outflow obstruction because of the risk of urinary retention [see *Contraindications (4)*].

5.2 Angioedema

Angioedema of the face, lips, tongue, and/or larynx has been reported with trospium chloride, the active ingredient in trospium chloride tablets. In one case, angioedema occurred after the first dose of trospium chloride. Angioedema associated with upper airway swelling may be life threatening. If involvement of the tongue, hypopharynx, or larynx occurs, trospium chloride tablets should be promptly discontinued and appropriate therapy and/or measures necessary to ensure a patent airway should be promptly provided.

5.3 Decreased Gastrointestinal Motility

Tropium chloride tablets should be administered with caution to patients with gastrointestinal obstructive disorders because of the risk of gastric retention [see *Contraindications (4)*]. Tropium chloride tablets, like other antimuscarinic agents, may decrease gastrointestinal motility and should be used with caution in patients with conditions such as ulcerative colitis, intestinal atony and myasthenia gravis.

5.4 Controlled Narrow-angle Glaucoma

In patients being treated for narrow-angle glaucoma, tropium chloride tablets should only be used if the potential benefits outweigh the risks and in that circumstance only with careful monitoring [see *Contraindications (4)*].

5.5 Central Nervous System Effects

Tropium chloride tablets are associated with anticholinergic central nervous system (CNS) effects [see *Adverse Reactions (6.2)*]. A variety of CNS anticholinergic effects have been reported, including dizziness, confusion, hallucinations and somnolence. Patients should be monitored for signs of anticholinergic CNS effects, particularly after beginning treatment or increasing the dose. Advise patients not to drive or operate heavy machinery until they know how tropium chloride tablets affect them. If a patient experiences anticholinergic CNS effects, dose reduction or drug discontinuation should be considered.

5.6 Anticholinergic Adverse Reactions in Patients with Moderate Renal Impairment

Tropium is substantially excreted by the kidney. The effects of moderate renal impairment on systemic exposure are not known but systemic exposure is likely increased. Therefore, anticholinergic adverse reactions (including dry mouth, constipation, dyspepsia, urinary tract infection, and urinary retention) are expected to be greater in patients with moderate renal impairment [see *Dosage and Administration (2)*, and *Use in Specific Populations (8.6)*].

6 ADVERSE REACTIONS

6.1 Clinical Trials Experience

Because clinical trials are conducted under widely varying conditions, the adverse reaction rates observed in the clinical trials of a drug cannot be directly compared to rates in the clinical trials of another drug and may not reflect the rates observed in clinical practice.

The safety of tropium chloride tablets was evaluated in controlled clinical trials in a total of 2975 patients, who were treated with tropium chloride tablets (N=1673), placebo (N=1056) or active control medications (N=246). Of this total, 1181 patients participated in two, 12-week, U.S., efficacy and safety studies and a 9-month open-label extension. Of this total, 591 patients received tropium chloride tablets 20 mg twice daily. In all controlled trials combined, 232 and 208 patients received treatment with tropium chloride tablets for at least 24 and 52 weeks, respectively.

In all placebo-controlled trials combined, the incidence of serious adverse events was 2.9% among patients receiving tropium chloride tablets 20 mg twice daily and 1.5% among patients receiving placebo. Table 1 lists adverse reactions from the combined 12-week U.S. safety and efficacy trials

were reported by at least 1% of patients, and were reported more frequently in the trospium chloride group than in the placebo group.

The two most common adverse reactions reported by patients receiving trospium chloride tablets 20 mg twice daily were dry mouth and constipation. The single most frequently reported adverse reaction for trospium chloride tablets, dry mouth, occurred in 20.1% of trospium chloride treated patients and 5.8% of patients receiving placebo. In the two U.S. studies, dry mouth led to discontinuation in 1.9% of patients treated with trospium chloride tablets 20 mg twice daily. For the patients who reported dry mouth, most had their first occurrence of the event within the first month of treatment.

Table 1. Incidence (%) of adverse reactions with trospium chloride, reported in greater than or equal to 1% of all patients treated with trospium chloride and more frequent with trospium chloride (20 mg twice daily) than placebo in Studies 1 and 2 combined		
Adverse Event	Placebo (N=590)	Trospium chloride 20 mg twice daily (N=591)
Gastrointestinal Disorders		
Dry mouth	34 (5.8)	119 (20.1)
Constipation	27 (4.6)	57 (9.6)
Abdominal pain upper	7 (1.2)	9 (1.5)
Constipation aggravated	5 (0.8)	8 (1.4)
Dyspepsia	2 (0.3)	7 (1.2)
Flatulence	5 (0.8)	7 (1.2)
Nervous System Disorders		
Headache	12 (2.0)	25 (4.2)
General disorders		
Fatigue	8 (1.4)	11 (1.9)
Renal and urinary disorders		
Urinary retention	2 (0.3)	7 (1.2)
Eye disorders		
Dry eyes NOS	2 (0.3)	7 (1.2)
Abbreviations: NOS=not otherwise specified		

Other adverse reactions from the U.S., placebo-controlled trials, occurring in greater than or equal to 0.5% and less than 1.0% of trospium chloride treated patients, and more common with trospium chloride tablets than placebo are: tachycardia, vision blurred, abdominal distension, vomiting, dysgeusia, dry throat, and dry skin.

During controlled clinical studies, one adverse reaction of angioneurotic edema was reported.

6.2 Post-marketing Experience

The following adverse reactions have been identified during post-approval use of trospium chloride. Because these reactions are reported voluntarily from a population of uncertain size, it is not always possible to reliably estimate their frequency or establish a causal relationship to drug exposure. Gastrointestinal – gastritis; Cardiovascular – palpitations, supraventricular tachycardia, chest pain, syncope, “hypertensive crisis”; Immunological – Stevens-Johnson syndrome, anaphylactic reaction,

angioedema; Nervous System – dizziness, confusion, vision abnormal, hallucinations, somnolence and delirium; Musculoskeletal – rhabdomyolysis; General – rash.

7 DRUG INTERACTIONS

7.1 Digoxin

Concomitant use of trospium chloride tablets and digoxin did not affect the pharmacokinetics of either drug [see *Clinical Pharmacology* (12.3)].

7.2 Drugs Eliminated by Active Tubular Secretion

Although demonstrated in a drug-drug interaction study not to affect the pharmacokinetics of digoxin, trospium chloride tablets have the potential for pharmacokinetic interactions with other drugs that are eliminated by active tubular secretion (e.g., procainamide, pancuronium, morphine, vancomycin, and tenofovir). Co-administration of trospium chloride tablets with these drugs may increase the serum concentration of trospium chloride tablets and/or the coadministered drug due to competition for this elimination pathway. Careful patient monitoring is recommended in patients receiving such drugs [see *Clinical Pharmacology* (12.3)].

7.3 Antimuscarinic Agents

The concomitant use of trospium chloride tablets with other antimuscarinic agents that produce dry mouth, constipation, and other anticholinergic pharmacological effects may increase the frequency and/or severity of such effects. Trospium chloride tablets may potentially alter the absorption of some concomitantly administered drugs due to anticholinergic effects on gastrointestinal motility.

7.4 Metformin

Co-administration of 500 mg metformin immediate release tablets twice daily with trospium chloride 60 mg extended release tablets reduced the steady-state systemic exposure of trospium by approximately 29% for mean AUC_{0-24} and by 34% for mean C_{max} [see *Clinical Pharmacology* (12.3)].

8 USE IN SPECIFIC POPULATIONS

8.1 Pregnancy

Teratogenic Effects

Pregnancy Category C: There are no adequate and well-controlled studies of trospium chloride tablets in pregnant women. Trospium chloride tablets should be used during pregnancy only if the potential benefit to the patient outweighs the risk to the patient and fetus. Women who become pregnant during trospium chloride treatment are encouraged to contact their physician.

Risk Summary

Based on animal data, trospium chloride tablets are predicted to have a low probability of increased risk of adverse developmental outcomes, above background risk. Adverse developmental findings were not observed to correlate with dose in rats or in rabbits. No increased risk above background was observed in rats and rabbits treated at an exposure approximately equivalent to the maximal recommended human dose (MRHD) of 40 mg.

Animal Data

In a rat embryo/fetal development study, pregnant rats received doses of trospium chloride up to 200 mg/kg/day, from implantation to closure of the fetal hard palate, with maternal systemic exposures corresponding to approximately nine times the exposure of women treated at the MRHD of 40 mg, based on AUC. No malformations or fetal toxicity were observed.

The offspring of female rats exposed orally, pre- and post-natally, to trospium chloride up to 200 mg/kg/day showed no increased developmental toxicity over background in surviving pups. However, maternal toxicity (death, irregular breathing, increased excitability) was observed at 200 mg/kg/day. A no-effect level for maternal and pup toxicity (survival to Day 4) was 20 mg/kg/day, an exposure approximately equivalent to the maximal recommended human dose (MRHD) of 40 mg.

In a rabbit embryo/fetal development study, pregnant rabbits received doses of trospium chloride up to 200 mg/kg/day, from implantation to closure of the fetal hard palate. At 200 mg/kg/day, maternal systemic exposures corresponded to approximately 16 times the exposure of women treated at the MRHD of 40 mg, based on AUC. However, one fetus in each of the three treated dose groups (0.3 to 16 times exposures at the MRHD) demonstrated multiple malformations, including umbilical hernia and skeletal malformations. A maternal no-effect level was set at 20 mg/kg/day, at an exposure approximately equivalent to the maximal recommended human dose (MRHD) of 40 mg, due to clinical signs (reduced feces, hunched posture, diarrhea) observed in a pharmacokinetic study at 200 mg/kg/day.

8.2 Labor and Delivery

The effect of trospium chloride tablets on labor and delivery is unknown.

8.3 Nursing Mothers

Trospium chloride (2 mg/kg orally and 50 mcg/kg intravenously) was excreted, to a limited extent (less than 1%), into the milk of lactating rats (primarily as parent compound). It is not known whether this drug is excreted in human milk. Because many drugs are excreted in human milk, trospium chloride tablets should be used during lactation only if the potential benefit justifies the potential risk to the newborn.

8.4 Pediatric Use

The safety and effectiveness of trospium chloride tablets in pediatric patients have not been established.

8.5 Geriatric Use

Of the 591 patients with overactive bladder who received treatment with trospium chloride in the two U.S., placebo-controlled, efficacy and safety studies, 249 patients (42%) were 65 years of age and older. Eighty-eight trospium chloride treated patients (15%) were greater than or equal to 75 years of age.

In these 2 studies, the incidence of commonly reported anticholinergic adverse reactions in patients treated with trospium chloride tablets (including dry mouth, constipation, dyspepsia, urinary tract

infection, and urinary retention) was higher in patients 75 years of age and older as compared to younger patients. This effect may be related to an enhanced sensitivity to anticholinergic agents in this patient population [see *Clinical Pharmacology* (12.3)]. Therefore, based upon tolerability, the dose frequency of trospium chloride tablets may be reduced to 20 mg once daily in patients 75 years of age and older.

8.6 Renal Impairment

Severe renal impairment (creatinine clearance less than 30 mL/minute) significantly altered the disposition of trospium chloride tablets. A 4.2-fold and 1.8-fold increase in mean $AUC_{(0-\infty)}$ and C_{max} , respectively, and the appearance of an additional elimination phase with a long half-life (~33 hr) were detected in patients with severe renal impairment compared with nearly age-matched subjects with creatinine clearance equal to or higher than 80 mL/min. The different pharmacokinetic behavior of trospium chloride tablets in patients with severe renal impairment necessitates adjustment of dosage frequency [see *Dosage and Administration* (2)]. The pharmacokinetics of trospium have not been studied in patients with creatinine clearance ranging from 30 to 80 mL/min.

Trospium is known to be substantially excreted by the kidney, and the risk of adverse reactions may be greater in patients with impaired renal function.

8.7 Hepatic Impairment

There is no information regarding the effect of severe hepatic impairment on exposure to trospium chloride tablets. In a study of patients with mild and with moderate hepatic impairment, given 40 mg of immediate-release trospium chloride, mean C_{max} increased 12% and 63%, respectively, and mean $AUC_{(0-\infty)}$ decreased 5% and 15%, respectively, compared to healthy subjects. The clinical significance of these findings is unknown. Caution should be used when administering trospium chloride to patients with moderate and severe hepatic impairment.

10 OVERDOSAGE

Overdosage with antimuscarinic agents, including trospium chloride tablets, can result in severe antimuscarinic effects. Supportive treatment should be provided according to symptoms. In the event of overdosage, electrocardiographic monitoring is recommended.

A 7-month-old baby experienced tachycardia and mydriasis after administration of a single dose of trospium 10 mg given by a sibling. The baby's weight was reported as 5 kg. Following admission into the hospital and about 1 hour after ingestion of the trospium, medicinal charcoal was administered for detoxification. While hospitalized, the baby experienced mydriasis and tachycardia up to 230 beats per minute. Therapeutic intervention was not deemed necessary. The baby was discharged as completely recovered the following day.

11 DESCRIPTION

Trospium chloride tablets, USP are a quaternary ammonium compound with the chemical name of (1 α ,3 β ,5 α)-3-[(Hydroxydiphenylacetyl)oxy]spiro[8-azoniabicyclo[3.2.1]octane-8,1'-pyrrolidinium] chloride. The molecular formula of trospium chloride is $C_{25}H_{30}ClNO_3$ and its molecular weight is 427.96. The structural formula of trospium chloride is represented below:

Trospium chloride, USP is a white to off-white powder. Very soluble in water.

Each trospium chloride tablet, USP contains 20 mg of trospium chloride and is to be given orally. Each tablet also contains the following inactive ingredients: lactose monohydrate, microcrystalline cellulose, croscarmellose sodium, magnesium stearate, colloidal silicon dioxide, hypromellose, hydroxypropylcellulose, polyethylene glycol, titanium dioxide and yellow iron oxide.

12 CLINICAL PHARMACOLOGY

12.1 Mechanism of Action

Trospium chloride tablets are a muscarinic antagonist.

Trospium chloride antagonizes the effect of acetylcholine on muscarinic receptors in cholinergically innervated organs including the bladder. Its parasympatholytic action reduces the tonus of smooth muscle in the bladder.

Receptor assays showed that trospium chloride has negligible affinity for nicotinic receptors as compared to muscarinic receptors at concentrations obtained from therapeutic doses.

12.2 Pharmacodynamics

Placebo-controlled studies employing urodynamic variables were conducted in patients with conditions characterized by involuntary detrusor contractions. The results demonstrate that trospium chloride tablets increases maximum cystometric bladder capacity and volume at first detrusor contraction.

Electrophysiology

The effect of 20 mg twice daily and up to 100 mg twice daily trospium chloride tablets on QT interval was evaluated in a single-blind, randomized, placebo and active (moxifloxacin 400 mg once daily) controlled 5 day parallel trial in 170 male and female healthy volunteer subjects aged 18 to 45 years. The QT interval was measured over a 24-hour period at steady state. The 100 mg twice daily dose of trospium chloride was chosen because this achieves the C_{max} expected in severe renal impairment. Trospium chloride tablets were not associated with an increase in individual corrected (QTcI) or Fridericia corrected (QTcF) QT interval at any time during steady state measurement, while moxifloxacin was associated with a 6.4 msec increase in QTcF.

In this study, asymptomatic, non-specific T wave inversions were observed more often in subjects receiving trospium chloride tablets than in subjects receiving moxifloxacin or placebo following five days of treatment. This finding was not observed during routine safety monitoring in 2 other placebo-controlled clinical trials in 591 trospium chloride treated overactive bladder patients [see *Clinical Studies* (14)]. The clinical significance of T wave inversion in this study is unknown. Trospium chloride tablets are associated with an increase in heart rate that correlates with increasing plasma concentrations. In the study described above, trospium chloride demonstrated a mean increase in heart rate compared to

placebo of 9.1 bpm for the 20 mg dose and of 18 bpm for the 100 mg dose. In the two U.S. placebo-controlled trials in patients with overactive bladder, the mean increase in heart rate compared to placebo in Study 1 was observed to be 3 bpm and in Study 2 was 4 bpm.

12.3 Pharmacokinetics

Absorption

After oral administration, less than 10% of the dose is absorbed. Mean absolute bioavailability of a 20 mg dose is 9.6% (range: 4 to 16.1%). Peak plasma concentrations (C_{max}) occur between 5 to 6 hours post-dose. Mean C_{max} increases greater than dose-proportionally; a 3-fold and 4-fold increase in C_{max} was observed for dose increases from 20 mg to 40 mg and from 20 mg to 60 mg, respectively. AUC exhibits dose linearity for single doses up to 60 mg. Trospium chloride tablets exhibit diurnal variability in exposure with a decrease in C_{max} and AUC of up to 59% and 33%, respectively, for evening relative to morning doses.

Effect of Food

Administration with a high (50%) fat-content meal resulted in reduced absorption, with AUC and C_{max} values 70 to 80% lower than those obtained when trospium chloride was administered while fasting. Therefore, it is recommended that trospium chloride tablets should be taken at least one hour prior to meals or on an empty stomach [see *Dosage and Administration (2)*].

A summary of mean (\pm standard deviation) pharmacokinetic parameters for a single 20 mg dose of trospium chloride tablets is provided in Table 2.

Table 2. Mean (\pmSD) Pharmacokinetic Parameter Estimates for a Single 20 mg Trospium Chloride Tablets Dose in Healthy Volunteers			
C_{max} (ng/mL)	AUC _{0-∞} (ng/mL · hr)	T _{max} (hr)	t _{1/2} (hr)
3.5 \pm 4.0	36.4 \pm 21.8	5.3 \pm 1.2	18.3 \pm 3.2

The mean plasma concentration-time (+ SD) profile for trospium chloride tablets is shown in Figure 1.

Figure 1 – Mean (+ SD) Concentration-Time Profile for a Single 20 mg Oral Dose of Trospium Chloride Tablets in Healthy Volunteers

Distribution

Protein binding ranged from 50 to 85% when concentration levels of trospium chloride (0.5 to 50 ng/mL) were incubated with human serum *in vitro*.

The ³H-trospium chloride ratio of plasma to whole blood was 1.6:1. This ratio indicates that the majority of ³H-trospium chloride is distributed in plasma.

The apparent volume of distribution for a 20 mg oral dose is 395 (± 140) liters.

Metabolism

The metabolic pathway of trospium in humans has not been fully defined. Of the 10% of the dose absorbed, metabolites account for approximately 40% of the excreted dose following oral administration. The major metabolic pathway is hypothesized as ester hydrolysis with subsequent conjugation of benzylic acid to form azoniaspironortropanol with glucuronic acid. Cytochrome P450 (CYP) is not expected to contribute significantly to the elimination of trospium. Data taken from *in vitro* human liver microsomes investigating the inhibitory effect of trospium on seven CYP isoenzyme substrates (CYP1A2, 2A6, 2C9, 2C19, 2D6, 2E1, and 3A4) suggest a lack of inhibition at clinically relevant concentrations.

Excretion

The plasma half-life for trospium chloride tablets following oral administration is approximately 20 hours. After oral administration of an immediate-release formulation of ¹⁴C-trospium chloride, the majority of the dose (85.2%) was recovered in feces and a smaller amount (5.8% of the dose) was recovered in urine; 60% of the radioactivity excreted in urine was unchanged trospium.

The mean renal clearance for trospium (29.07 L/hour) is 4-fold higher than average glomerular filtration rate, indicating that active tubular secretion is a major route of elimination for trospium. There may be competition for elimination with other compounds that are also renally eliminated [see *Drug Interactions* (7.2)].

Drug Interactions

Digoxin: Concomitant use of 20 mg trospium chloride immediate release tablets twice daily at steady state and a single dose of 0.5 mg digoxin in a crossover study with 40 male and female subjects did not

affect the pharmacokinetics of either drug.

Metformin: A drug interaction study was conducted in which trospium chloride 60 mg extended release tablets once daily was co-administered with Glucophage[®] (metformin hydrochloride) 500 mg twice daily under steady-state conditions in 44 healthy subjects. Co-administration of 500 mg metformin immediate release tablets twice daily reduced the steady-state systemic exposure of trospium by approximately 29% for mean AUC₀₋₂₄ and by 34% for mean C_{max}. The effect of decrease in trospium exposure on the efficacy of trospium chloride tablets is unknown. The steady-state pharmacokinetics of metformin were comparable when administered with or without 60 mg trospium chloride extended release tablets once daily under fasted condition. The effect of metformin at higher doses on trospium PK is unknown.

Specific Populations

Age: Age did not appear to significantly affect the pharmacokinetics of trospium chloride, however, increased anticholinergic side effects unrelated to drug exposure were observed in patients greater than or equal to 75 years of age [see *Use in Specific Populations (8.5)*].

Pediatric: The pharmacokinetics of trospium chloride tablets were not evaluated in pediatric patients.

Race: Pharmacokinetic differences due to race have not been studied.

Gender: Studies comparing the pharmacokinetics in different genders had conflicting results. When a single 40 mg trospium chloride tablets dose was administered to 16 elderly subjects, exposure was 45% lower in elderly females compared to elderly males. When 20 mg trospium chloride tablets were dosed twice daily for 4 days to 6 elderly males and 6 elderly females (60 to 75 years), AUC and C_{max} were 26% and 68% higher, respectively, in females without hormone replacement therapy than in males.

Renal Impairment: In a clinical pharmacokinetic study where a single dose of 40 mg immediate release trospium chloride tablets were administered to 12 healthy males and 12 males with severe renal impairment, severe renal impairment (creatinine clearance less than 30 mL/minute) significantly altered the disposition of trospium chloride tablets. A 4.2-fold and 1.8-fold increase in mean AUC_(0-∞) and C_{max}, respectively, and the appearance of an additional elimination phase with a long half-life (~33 hours vs. 18 hours) were detected in patients with severe renal impairment compared with nearly age-matched subjects with creatinine clearance equal to or higher than 80 mL/min. The different pharmacokinetic behavior of trospium chloride tablets in patients with severe renal impairment necessitates adjustment of dosage frequency [see *Dosage and Administration (2)*]. The pharmacokinetics of trospium have not been studied in patients with creatinine clearance ranging from 30 to 80 mL/min.

Hepatic Impairment: In a clinical pharmacokinetic study in patients with mild (Child-Pugh score 5 to 6) and with moderate (Child-Pugh score 7 to 8) hepatic impairment, given a single dose of 40 mg immediate-release trospium chloride tablets, mean C_{max} increased 12% and 63%, respectively, and mean AUC_(0-∞) decreased 5% and 15%, respectively, compared to healthy subjects. There is no information regarding the effect of severe hepatic impairment on exposure to trospium chloride tablets.

13 NONCLINICAL TOXICOLOGY

13.1 Carcinogenesis, Mutagenesis, Impairment of Fertility

Carcinogenesis

Carcinogenicity studies with trospium chloride tablets were conducted in mice and rats for 78 weeks and 104 weeks, respectively, at maximally tolerated doses. No evidence of a carcinogenic effect was

found in either mice or rats administered up to 200 mg/kg/day, approximately 9 times the expected clinical exposure levels at the maximum recommended human dose (MRHD) of 40 mg.

Mutagenesis

Trospium chloride was not mutagenic nor genotoxic in tests *in vitro* in bacteria (Ames test) and mammalian cells (L5178Y mouse lymphoma and CHO cells) or *in vivo* in the rat micronucleus test.

Impairment of Fertility

No evidence of impaired fertility was observed in rats administered doses up to 200 mg/kg/day (about 16 times the expected clinical exposure at the MRHD, based on AUC).

14 CLINICAL STUDIES

Trospium chloride tablets were evaluated for the treatment of patients with overactive bladder who had symptoms of urinary frequency, urgency, and urge incontinence in two U.S. 12-week, placebo-controlled studies and one 9-month open label extension.

Study 1 was a randomized, double-blind, placebo-controlled, parallel-group study in 523 patients. A total of 262 patients received trospium chloride 20 mg twice daily and 261 patients received placebo. The majority of patients were Caucasian (85%) and female (74%) with a mean age of 61 years (range: 21 to 90 years). Entry criteria required that patients have urge or mixed incontinence (with a predominance of urge), urge incontinence episodes of at least 7 per week, and greater than 70 micturitions per week. The patient's medical history and urinary diary during the treatment-free baseline confirmed the diagnosis. Reductions in urinary frequency, urge incontinence episodes and urinary void volume for placebo and trospium chloride tablets treatment groups are summarized in Table 3 and Figures 2 and 3.

Table 3. Mean (SE) change from baseline to end of treatment (Week 12 or last observation carried forward) for urinary frequency, urge incontinence episodes, and void volume in Study 1.			
Efficacy endpoint	Placebo N=256	Trospium chloride N=253	P-value
Urinary frequency/24hours^{a,*}			
Mean baseline	12.9	12.7	<0.001
Mean change from baseline	-1.3 (0.2)	-2.4 (0.2)	
Urge incontinence episodes/week^{b,*}			
Mean baseline	30.1	27.3	0.012
Mean change from baseline	-13.9 (1.2)	-15.4 (1.1)	
Urinary void volume/toilet void (mL)^{a,c}			
Mean baseline	156.6	155.1	<0.001
Mean change from baseline	7.7 (3.1)	32.1 (3.1)	
^a Treatment differences assessed by analysis of variance for ITT:LOCF data set. ^b Treatment differences assessed by ranked analysis of variance for ITT:LOCF data set. ^c Placebo N=253, Trospium chloride N=248 *Denotes co-primary endpoint			

ITT= intent to treat, LOCF=last observation carried forward.

Figure 2 – Mean Change from Baseline in Urinary Frequency/24 Hours, by Visit: Study 1

Figure 3 – Mean Change from Baseline in Urge Incontinence/Week, by Visit: Study 1

Study 2 was nearly identical in design to Study 1. A total of 329 patients received trospium chloride 20 mg twice daily and 329 patients received placebo. The majority of patients were Caucasian (88%) and

female (82%) with a mean age of 61 years (range: 19 to 94 years). Entry criteria were identical to Study 1. Reductions in urinary frequency, urge incontinence episodes, and urinary void volume for placebo and trospium chloride treatment groups are summarized in Table 4 and Figures 4 and 5.

Table 4. Mean (SE) change from baseline to end of treatment (Week 12 or last observation carried forward) for urinary frequency, urge incontinence episodes, and void volume in Study 2.			
Efficacy endpoint	Placebo N=325	Trospium chloride N=323	P-value
Urinary frequency/24hours^{a,*}			
Mean baseline	13.2	12.9	
Mean change from baseline	-1.8 (0.2)	-2.7 (0.2)	<0.001
Urge incontinence episodes/week^b			
Mean baseline	27.3	26.9	
Mean change from baseline	-12.1 (1.0)	-16.1 (1.0)	<0.001
Urinary void volume/toilet void (mL)^{a,c}			
Mean baseline	154.6	154.8	
Mean change from baseline	9.4 (2.8)	35.6 (2.8)	<0.001

16 HOW SUPPLIED/STORAGE AND HANDLING

Trosipium chloride tablets, USP 20 mg (brownish-yellow, round, biconvex, film-coated tablets, engraved “APO” on one side and “TR” over “20” on the other side) are supplied as follows:

Bottles of 60 NDC 60505-3454-6
 Bottles of 500 NDC 60505-3454-5
 Bottles of 1000 NDC 60505-3454-8

Store at 20° to 25°C (68° to 77°F); excursions permitted to 15° to 30°C (59° to 86°F) [see USP Controlled Room Temperature].

17 PATIENT COUNSELING INFORMATION

“See FDA-approved Patient Labeling (Patient Information)”

17.1 Angioedema

Patients should be informed that trosipium chloride, the active ingredient in trosipium chloride tablets, may produce angioedema which could result in life-threatening airway obstruction. Patients should be advised to promptly discontinue trosipium chloride tablets and seek immediate medical attention if they experience edema of the tongue, edema of the laryngopharynx, or difficulty breathing.

17.2 When Not to Use

Prior to treatment, patients should fully understand the risks and benefits of trosipium chloride tablets. In particular, patients should be informed not to take trosipium chloride tablets if they:

- have urinary retention;
- gastric retention;
- uncontrolled narrow-angle glaucoma;
- are allergic to any component of trosipium chloride tablets.

17.3 Administration

Patients should be instructed regarding the recommended dosing and administration of trospium chloride tablets:

- Take one trospium chloride tablet twice daily with water.
- Take trospium chloride tablets on an empty stomach or at least 1 hour before a meal.

17.4 Adverse Reactions

Patients should be informed that the most common side effects with trospium chloride tablets are dry mouth and constipation and that other less common side effects include trouble emptying the bladder, blurred vision, and heat prostration. Because anticholinergics, such as trospium chloride, may produce dizziness or blurred vision, patients should be advised to exercise caution in decisions to engage in potentially dangerous activities until the drug's effects have been determined. Patients should be informed that alcohol may enhance the drowsiness caused by anticholinergic agents.

Patient Information

Trospium Chloride Tablets, USP

Read the Patient Information that comes with trospium chloride tablets before you start taking it and each time you get a refill. There may be new information. This leaflet does not take the place of talking with your doctor about your medical condition or your treatment.

What are trospium chloride tablets?

Trospium chloride tablets are a prescription medicine used to treat adults with overactive bladder who have the following symptoms:

- a strong need to urinate right away;
- leaking or wetting accidents due to a strong need to urinate right away;
- a need to urinate often.

Who should not take trospium chloride tablets?

Do not take trospium chloride tablets if you:

- have trouble emptying your bladder;
- have delayed or slow emptying of your stomach;
- have an eye problem called “uncontrolled narrow-angle glaucoma”;
- are allergic to trospium chloride tablets or any of its ingredients. See the end of this leaflet for a complete list of ingredients.

Trospium chloride tablets have not been studied in children under the age of 18 years.

What should I tell my doctor before starting trospium chloride tablets?

Tell your doctor about all of your medical conditions including if you:

- have any stomach or intestinal problems or problems with constipation;
- have trouble emptying your bladder or have a weak urine stream;
- have an eye problem called narrow-angle glaucoma;
- have kidney problems;
- have liver problems;
- are pregnant or planning to become pregnant. It is not known if trospium chloride can harm your unborn baby.
- are breastfeeding. It is not known if trospium chloride passes into breast milk and if it can harm your baby.

You should talk to your doctor about the best way to feed your baby if you are taking trospium chloride tablets.

Tell your doctor about all the medicines you take including prescription and nonprescription medicines, vitamins and herbal supplements. Trospium chloride tablets and certain other medicines can interact and make some side effects worse. Trospium chloride tablets can affect how other medicines are handled by the body.

Know all the medicines you take. Keep a list of them with you to show your doctor and pharmacist each time you get a new medicine.

How should I take trospium chloride tablets?

Take trospium chloride tablets exactly as prescribed.

- Take one trospium chloride tablet twice daily with water.
- Take trospium chloride tablets on an empty stomach or at least 1 hour before a meal.
- If you take too much trospium chloride, call your local Poison Control Center or go to an emergency room right away.

What are the possible side effects of trospium chloride?

Trospium chloride may cause allergic reactions that may be serious. Symptoms of a serious allergic reaction may include swelling of the face, lips, throat or tongue. If you experience these symptoms, you should stop taking trospium chloride tablets and get emergency medical help right away.

The most common side effects with trospium chloride tablets are:

- dry mouth;
- constipation;
- headache.

Trospium chloride tablets may cause other less common side effects, including:

- trouble emptying the bladder;
- blurred vision; and drowsiness. Do not drive or operate heavy machinery until you know how trospium chloride tablets affect you. Alcohol can worsen the drowsiness caused by drugs such as trospium chloride tablets.
- heat prostration. Due to decreased sweating, heat prostration can occur when drugs such as trospium chloride tablets are used in a hot environment.

Tell your doctor if you have any side effects that bother you or that do not go away.

These are not all possible side effects of trospium chloride tablets. For more information, ask your doctor, healthcare professional or pharmacist.

How should I store trospium chloride tablets?

- Keep trospium chloride tablets and all other medicines out of the reach of children.
- Store trospium chloride tablets at room temperature, 68° to 77°F (20° to 25°C).
- Safely dispose of trospium chloride tablets that are out of date or that you no longer need.

General information about trospium chloride tablets

Medicines are sometimes prescribed for conditions that are not mentioned in patient information leaflets. Do not use trospium chloride tablets for a condition for which it was not prescribed. Do not give trospium chloride tablets to other people, even if they have the same symptoms you have. It may harm them.

This leaflet summarizes the most important information about trospium chloride tablets. If you would like more information, talk with your doctor. You can ask your doctor or pharmacist for information about trospium chloride tablets that is written for health professionals.

What are the ingredients in trospium chloride tablets?

Each tablet contains the following inactive ingredients: lactose monohydrate, microcrystalline cellulose, croscarmellose sodium, magnesium stearate, colloidal silicon dioxide, hypromellose, hydroxypropylcellulose, polyethylene glycol, titanium dioxide and yellow iron oxide.
